WriteUps :

Algorithm:

- •Create a Maven Project
- • Add the selenium and web Manager Dependencies in the POM.xml file
- • Create a package Features,Runner,Step and in that we need to create a file in Feature,and create class in Runner,Step. and implement method to take different driver to perform test in different envoirment and browser
- • Create another class in Step package AmazonTestPage . And we need to the page link and we have to write the code by using @Then @And @Given
- • Now we need to run the code
- • Then we will get output
- • Create a repository in the GitHub
- • And push all the files in the repository.
